

Maxillofacial Surgery

The complex Maxillofacial Surgery operational unit takes care of cranial-maxillo-facial and neck disorders. In particular, it operates in the following fields:

- traumatic pathology
- oncological pathology: Benign and malignant tumors of the mouth, face, salivary glands, orbital region, neck. In these cases, the operation involves the removal of the tumor and, if necessary, the reconstruction of the defective part by means of sophisticated microsurgical techniques
- facial anomalies, either congenital (emifacial microsomies, cleft lip and palate, anomalies of the ear) or acquired (skeletal abnormalities of the jaws such as Prognathism, asymmetry, operated both from the occlusal and aesthetic viewpoint)
- Cosmetic Surgery (Rhinoplasty, otoplasty, blepharoplasty, genoplasty) and preprosthetic surgery which are carried out under by private physicians in a public health-institute.
